SUMMARY

I am a skilled **Python** developer with **3 years** of hands-on experience in designing, implementing, and maintaining software applications. My expertise includes **fullstack development**, where I have successfully utilized Python frameworks such as **Django and Flask** to build robust and scalable web applications. I have a solid understanding of database design and integration, using technologies like **SQL**, Python, **Selenium** and **Robot framework**.

EDUCATION

B.Tech, Computer Science and Engineering
G.H Rasoni College Of Engineering, Nagpur

May 2017 - Jul 2021
GPA: 8.0

EXPERIENCE

Software Engineer, L&T Technology Services and Limited

Aug 2021 - Present

- Developed an automation tool in Python named Auto Script to optimize testing procedures for web and desktop applications, automating 90% of test case execution.
- Implemented keyword-driven logic for processing test cases from text or voice input, generating xPaths for efficient script creation, and introduced self-healing functionality to improve script robustness and maintainability.
- Successfully automated a QT-based Windows application using PyAutoGUI by utilizing x, y coordinates due to lack of support for inspecting xPaths.
- Automated multiple desktop applications using PyAutoGUI and various web applications using Robot Framework with Selenium.
- Designed and created a user-friendly desktop application using Python's Tkinter library to compare XML files, enhancing user experience and simplifying the process of identifying differences. The application also generates detailed log reports highlighting any discrepancies found during the comparison process.
- Automated client website for Danfoss using Robot Framework and Selenium, and developed unit tests for Python-written test cases.
- Received training in various testing tools including Cognation, Postman, and Robot Framework.

PROJECTS

Cognition(2021)

- In this project, we developed a test automation tool which can write and execute test cases in python and robot framework .It was developed using Python for Windows, mobile and Desktop Applications.
- Responsible for developing backend using Python-Robot Framework.
- My role is to enhance the application based on client requirement.
- I convert the robot testcases in robot file and will execute the robot file .

Autoscript(2022-2023)

- In Auto script project, we developed a tool named Auto Script using python. It can automate web, desktop and android application with only 10% of human efforts. This tool takes test cases as input text or voice format. This input then gets processed by keywords defined at backend and based on that xpaths are generated. This way we have a skeleton done and executable scripts are generated.
- AutoScript is a script generator tool which takes test case as input in plain text or voice and produces test scripts in multiple languages like Python, Robot Framework and Javascript. Based on the test case, it auto-locates the web elements and its respective element id's and stores them into xpath file.
- We then can run scripts on various platforms like windows, linux, MacOS.
- It has a feature of self-Heal and Resilience capability for Auto generated scripts with zero manual intervention which brings down the test effort by 90%.
- It has support for English & 40 languages.

Hue Finder(2023)

- It was made during Hackathon. This project is made to identify hues or colours within an image where user can automatically get the name of the colour by clicking on input image.
- For this, I built a data file that contains 865 color names along with their RGB and hex values. Using this data set, I calculated the distance from each color and find the shortest one. This application can be used in self-driving cars and is helpful for color blind people.

SKILLS

SKILLS: Programming languages: Python , C++, Selenium , Frameworks: Robot Framework, Selenium, Pytest, Flask, Django, Database: MYSQL , DBMS
