- Led a team of developers to deliver a project on time and within budget.

Education and Certifications:

- Mca Niis Group of Institutions Bhubaneswar Odisha 2024

Relevant Coursework: Data Structures and Algorithms, Object-Oriented Programming, Web Development, Database Management

PERSONAL PROJECTS:**Simple Calculator Using java.**

- By using “Java” switch cases or if-else statements.
- I have created This calculator takes two operands and an arithmetic operator (+, -, *, /) from the user, however, you can expand the program to accept more than two operands and one operator by adding logic.
- Then, based on the operator entered by the user, it conducts the computation on the two operands.
- The input, however, must be in the format “number1 operator1 number2” (i.e., 2+4).

Calendar Using java.

- I had this funny incident happen with my friend who lost track of days, so she and I created this Calendar using “java”.
- The Calendar is written in the Java programming language, and this Calendar assists you in determining the date and day you require.
- We can implement it using simple if-else logic and switch-case statements.
- The display () function is used to display the calendar and it can be modified accordingly.
